ABSTRACT

Chalcone, an α,β-unsaturated ketone, has been shown to have many biological activities such as anticancer and antifungul. This research was conducted to synthesize the chalcone derivatives and to obtain their cytotoxic activity on human cervix cancer cell lines. Synthesis of chalcone and its derivatives, 4'-methylchalcone, 4'-methoxychalcone, and 3',4'-dichlorochalcone was carried out using starting materials of benzaldehyde and acetophenone, p-methylacetophenone, p-methoxyacetophenone, and m,p-dichloroacetophenone through Claisen Schmidt condensation catalyzed by NaOH in ethanol at 15 °C. The purity of synthesized compounds were analyzed by thin layer chromatography, melting range, and gas chromatography. Structure elucidations were conducted by UV spectrophotometer, IR spectrometer, ¹H-NMR spectrometer, and as well as mass spectrometer. Cytotoxic activities were determined by 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide (MTT) microculture tetrazolium viability assay. The results showed that chalcone and derivatives compounds have been able to be synthesized and purified and had the same structure as a predicted structure. Chalcone had highest cytotoxic activity compared to that of its derivatives, with the IC₅₀ values of chalcone, 4'-methylchalcone, 4'-methoxychalcone, and 3',4'-dichlorochalcone were 9.49, 14.79, 11.48, and 24.26 µg/mL respectively. It was concluded that methyl, methoxy as well as chlorine substitution at 3' and 4' position decrease the cytotoxic activity of chalcone.

INTRODUCTION

Among the α, β-unsaturated carbonyl ketones, chalcones is small-molecule aromatic enone analogue of curcumin. Pharmacophore model of chalcone has divided into three regions (Fig. 1). Region A requires an aromatic ring, region B is composed of an enone, and region C requires an aromatic ring, too. A rational
approach following standard medicinal chemistry design concepts was to explore compounds with systematic differences in carbon chain connecting the two aromatic regions[1].

Chalcone is an aromatic ketone which forms the central core for a variety of important biological compounds [2]. Chalcones have been reported to have a wide variety of biological activities, such as antimicrobial [3], anticancer, antioxidant and anti-inflammatory [4-5]. Some chalcones showed the ability to block voltage-dependent potassium channels [6]. Chalcones also potentially inhibit the NF-κB pathway. Nuclear factor (NF)-κB is a mediator of inflammatory diseases and cancer and has been shown to induce resistance to various chemotherapeutic agents. The reduction of the alkyne into a single bond completely attenuates their inhibition potential [7]. A number of α,β-unsaturated carbonyl ketones (2-propen-1-one) which are associated with various alkylating agents used in cancer chemotherapy. The antitumor activity, suggesting that the effect can be in the electron transporting chain. One of the electrophilic sites in the chalcone moiety can be found at the C3 carbon atom of the 2-propen-1-one moiety [8].

Utami [9] had synthesized chalcone and its derivatives based on Vogel method [10] by modifications of electron donating group and electron withdrawing group to C-4 of aromatic ring attached to α, β-unsaturated carbonyl ketones. This chalcone compound had cytotoxic activity on HeLa cell line. Hori-Huey Ko [11] reported the increasing of lipophilicity of the chalcones after introduction of a lipophilic alkyl group at the aromatic ring which directly attached to the keton carbonyl. These increasing significantly enhanced the inhibitory effects on NO production in macrophages, the important mediator in inflammatory process. The chalcone and its derivatives were synthesized by modifying a substituent group i.e. methyl, methoxy, and chloro at the 4' position in the aromatic ring directly attached to the keton carbonyl. The introduction of an substituent group in the aromatic

Fig 1. Pharmacophore model of chalcone

Fig 2. The disconnection of chalcone and its derivatives
C-ring (Fig. 1) of chalcone increased the lipophilicity.

This research was conducted to synthesize the chalcone derivatives and to obtain their cytotoxic activity on human breast cancer cell lines. The design of synthesis of chalcone and its derivatives, 4′-methylene chalcone, 4′-methoxy chalcone, and 3′,4′-dichloro chalcone could be approached by disconnection Stuart Waren method. This method illustrates the planning of synthesis would be carried out. It was started from the target molecule and break down by a series of disconnections into possible starting materials. Based on those analysis (Fig. 2), the synthesis of chalcone and its derivatives, 4′-methylene chalcone, 4′-methoxy chalcone, and 3′,4′-dichloro chalcone could be carried out using benzaldehyde, acetophenone and acetophenone derivatives, p-methylacetophenone, p-methoxy acetophenone, as well as m,p,dichloroacetophenone as starting materials.

In this, study chalcone and its derivatives, 4′-methylene chalcone, 4′-methoxychalcone, and 3′,4′-dichlorochalcone, were synthesized by the alkaline Claisen-Schmidt condensation of acetophenone (1), p-methyl acetophenone (2), p-methoxyacetophenone (3), m,p-dichloroacetophenone (4), and benzaldehyde. Chalcone and its derivatives then were determined their cytotoxic activity by 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide (MTT) microculture tetrazolium viability assay.

**EXPERIMENTAL SECTION**

**Materials**

Benzaldehyde 97% (Janssen Chimica), acetophenone 98% (E-Merck), p-methylacetophenone, p-methoxyacetophenone, m,p-dichloroacetophenone (Molnay Laboratory of Universitas Gadjah Mada), ethyl alcohol 96% (E-Merck); sodium hydroxide (NaOH) (E-Merck), litmus paper (Sigma), ice solid, aquades, chloroform (E-Merck), n-hexane (E-Merck), methanol (E-Merck), ethyl acetate (E-Merck), filter paper, HeLa cell line, RPMI 1640 powder (GIBCO), growth medium contain growth factor 10% FBS (Fetal Bovine Serum) – 0.5% fungison – 2% penicillin and streptomycin (GIBCO) and RPMI 1640 medium, DMSO, sodium bicarbonate p.a. (Sigma), MT (3-[4,5-Dimethylthiazol-2-yl]-2,5-diphenyltetrazolium Bromide), Phosphate Buffer Saline, solution 10% of sodium dodecyl sulphate (SDS) in HCl 0.01 N, primer antibody p53 and cyclooxygenase-2 (COX-2).

**Instrumentation**

A set of glassware for synthesis, the analytical balance Mettler AT-200, thermometer, stirrer 3 cm,

**Termcopan (Reichert Austria, Nr. 340 579), thin layer chromatography (TLC) silica gel GF254 (E-Merck), ultraviolet lamp 254 nm and 366 nm, Buchi Melting Point B-540, the UV-Vis spectrum were recorded on Spectronic 3000 Array Milton Roy, the IR spectrum were recorded on Shimadzu FTIR-6201 PC, the H-magnetic resonance spectrum were performed using JNM-MY 60 JEOL in CDCl3, the mass spectrum were recorded using GMS-QP2010S SHIMADZU with Rtx-5MS column (length 30 m; ID 0.25 mm; column Oven Temperature: 150 °C, Injection Temperature: 320 °C), Helium as mobile gas, EI ionization, Oven temperature was set from 150 °C (hold time 5 min) to 250 °C (hold time was 31 min). Liquid nitrogen tank, centrifuge Sigma 3K12 (B. Braun Biotech International), CO2 Incubator (Nuair™ IR autoflow), Laminair Air Flow Cabinet (Nuair™), ELISA reader (SLT 240 ATC), sterile conical flask (Nuncclone), tissue culture flask (Nuncclone), microplate 96 wells, electrical balance (Sartorius), micropipette, vortex.

**Procedure**

**Synthesis of chalcone derivatives**

Chalcone and its derivatives were prepared by adding NaOH solution (0.14 mol; 0.56 g in 3.75 mL of water) to an equimolar aldehyde (0.005 mol) and ketone (0.005 mol) solution in ethyl alcohol. The reaction mixture was stirred at about 15 °C for 3 h with constant stirring. The stirrer was removed and the reaction mixture was left in the refrigerator at 15 °C for 24 h. The yellow precipitate then was collected by vacuum filtration, washed with cold water until neutral to litmus, and the precipitate was washed with 6 mL of cold ethyl alcohol and dried in the air. The products were purified by recrystallization from ethyl alcohol. Structure elucidations were conducted by UV spectrophotometer, 1H-NMR spectrometer, IR spectrometer, as well as mass spectrometer. The structures of the products were shown in Fig. 3.

**Cytotoxic test**

Cytotoxic activity was determined with 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide (MTT) microculture tetrazolium viability assay.

**Cell culture preparation.** Human cervical cancer cell line (HeLa cell line) was grown in RPMI medium in tissue culture flask. The supernatant was transferred to sterile conical flask, and was centrifuged (700 rpm x 10 min). The supernatant was removed, and 1 mL of growth medium in PBS 10% was added to the pellet part, and slowly resuspended. Ten μL of cell suspension was diluted in PBS 10%, and the cell count was determined using hemocytometer. Cell count in
suspension was adjusted by dilution.

**Preparation of test compounds solution.** One mL of stock solution of p-methoxychalcone and its derivatives in DMSO pro culture were made in concentration of 5000 µM. The stock solution was diluted to obtain concentrations of 100 µg/mL, 50 µg/mL, 25 µg/mL, 12.5 µg/mL, 6.25 µg/mL, as well as 3.125 µg/mL. The stock solution preparation and test solution dilution were conducted in laminar air flow cabinet.

**MTT assay.** The cells were seeded at a concentration of 3x10^3 cells/well in 100 µL culture medium and incubated at 37 °C in 5% CO₂ incubator for 24 h, then 100 µL of different concentrations of test compound was added. The microplates were kept for incubation at 37 °C in 5% CO₂ incubator for 24 h and cells were periodically checked for granularity, shrinkage, swelling. After 24 h, the sample solution in wells was flicked off and 10 µL of MTT dye was added to each well. The plates were gently shaken and incubated for 4 h at 37 °C in 5% CO₂ incubator. Live cells would react with MTT to produce violet color of formazan. The supernatant was removed and 100 µL of SDS 10% in 0.01 N HCl was added and the plates were gently shaken to solubilize the formed formazan. The mixtures were incubated for 24 h at room temperature. The absorbance was measured using a microplate reader at 550 nm. Positive control test was conducted without test compound, while blank test was conducted for the solvent without test compound.

**RESULT AND DISCUSSION**

**Synthesis of Chalcone Derivatives**

Synthesis of chalcone and its derivatives, 4'-methylchalcone, 4'-methoxychalcone, and 3',4'-dichlorochalcone, using the Claisen-Schmidt condensation of benzaldehyde with acetophenone and their derivatives, p-methylacetophenone, p-methoxyacetophenone, as well as m,p-dichloracetophenone were done in base condition using NaOH catalyst based on Vogel method. Chalcone was able to be synthesized by reacting benzaldehyde and acetophenone, while chalcone derivatives, 4'-methyl chalcone, 4',m-methoxychalcone, 3',4'-dichlorochalcone, were able to be synthesized by reacting benzaldehyde and p-methylacetophenone, p-methoxyacetophenone, m,p-dichloracetophenone, respectively.

Sodium hydroxide was used to increase rate of reaction. The rate of catalysis reaction will be faster than acid catalysis reaction, due to the formation of enolate anion in the base catalysis, that is more reactive than enol form that formed by acid catalysis. The general reaction can mechanism of the formation of chalcones and its derivatives were illustrated in Fig. 4 and 5.

All the compounds gave a single spot in TLC analysis and posses the very sharp melting range, so
they were concluded that the compounds were pure. Purity of the synthesis products were also proved by the melting range (under 2 °C). The melting ranges of chalcone, 4'-methylchalcone, 4'-methoxychalcone and 3',4'-dichlorochalcone was 54.4-55.6 °C (lit. [9] 57.4-59.3 °C), 50.4-51.9 °C (lit. [12] 50-51 °C), 107.6-108.2 °C (lit. [13] 107.7-108.6 °C), and 116.8-118.1 °C (lit. [14] 116.4-116.1 °C), respectively. After identification by spectroscopic methods, i.e., infrared spectroscopy, nuclear magnetic resonance as well as mass spectrometry, the structures could be confirmed.

The absorption band of carbonyl groups of benzaldehyde, acetophenone, p-methylacetophenone, p-methoxyacetophenone, and m,p-dichloroacetophenone in the UV region were shifted to the longer wavelengths after the carbonyl group was conjugated to a double bond in chalcone, 4'-methylchalcone, 4'-methoxychalcone, as well as 3',4'-dichlorochalcone.

It was proved that chalcone, 4'-methylchalcone, 4'-methoxychalcone, 3',4'-dichlorochalcone, were the α, β-unsaturated carbonyl compounds [5].

Benzaldehyde showed IR absorption at 1700 cm⁻¹ indicating the presence of a carbonyl group (C=O), while acetophenone, p-methylacetophenone, p-methoxyacetophenone as well as m,p-dichloroacetophenone showed a band at 1681.8, 1855.7, 1670.2 and 1685.7 cm⁻¹, respectively. The IR absorption frequency of a carbonyl group (C=O) of chalcones showed at 1658.7 cm⁻¹, while chalcone derivatives, 4'-methylchalcone, 4'-methoxychalcone, 3',4'-dichlorochalcone showed IR absorption of a carbonyl group (C=O) at 1658.78, 1651.07, and 1658.78 cm⁻¹, respectively. It was proved that chalcone, 4'-methylchalcone, 4'-methoxychalcone, 3',4'-dichlorochalcone, were the α, β-unsaturated carbonyl compounds.

Mass spectroscopy data were used to determine the molecular weight of each synthesized compound. Mass spectroscopy analysis was performed on the MS coupled GC with the injector temperature of 320 °C. The column temperature was set from 150 °C, maintained for 5 min and then increased 10 °C/min to achieve 290 °C. The temperature was kept on 290 °C for 3 min to allow the compound volatile, run through the column and the results of fragmentation could be separated based on the m/z value.

Utami [9] has synthesized related chalcones compound i.e. 4'-methylchalcone, but using different reaction and synthesis method. However the structure elucidation results showed the same profiles. GC-MS spectrum of our synthesized product showed the same peak of molecular ion (M, C₁₅H₂₂O₂) as that of Utami [9] on m/z = 200. Complete results of identification of the synthesis products were described below.

**Chalcone (1), C₁₅H₁₆O₂**

It was crystallized from ethyl alcohol as yellow precipitates (0.5842 g), yield 56.17%, m.p. 54.4-55.6 °C (lit. [9] 57.4-59.3 °C); Rf = 0.58 (Benzene); the retention time of GC = 6.117 min.

UV-Vis (λmax CHCl₃) = 241 and 313 nm. IR spectrum (νmax cm⁻¹, KBr) = 1658.78 (C=O, str. ketone), 1604.77 (C=C, str. alkene), 3062.77 (=CH₂, str. alkene aliphatic and aromatic), 1496.76 (C=C, str. aromatic). 1H-NMR (60 MHz, CDCl₃, 5 (ppm)) = 8.25-7.90 (m, 3H, =CH=β, Ar 2', 6'-H); 7.90-7.30 (m, 9H, =CH₃, Ar 3', 5', 3', 5', 2', 6', 3', 5', 4'-H). Mass spectrum (EI, m/z) = 158 (M⁺, C₁₅H₂₂O₂, 67.75%), 208 (M₁, C₁₄H₂₁O₂, 100%), 179 (C₁₄H₁₉, 51.89%), 165 (C₁₃H₁₃, 8.00%), 131 (C₁₂H₁₂O₂, 47.67%), 103 (C₁₀H₈O₂, 41.45%), 77 (C₁₀H₆O₂, 51%), 51 (C₈H₆O₂, 25.41%).

**4'-Methylchalcone (2), C₁₅H₁₇O₂**

It was crystallized from ethyl alcohol as yellow precipitates (0.6256 g), yield 56.36%, m.p. 50.4-51.9 °C (lit. [12] 50-59 °C); Rf = 0.67 (benzene); the retention time of GC = 9.966 min.

UV-Vis (λmax, CHCl₃) = 240 and 314 nm. IR spectrum (νmax cm⁻¹, KBr) = 1658.78 (C=O, str. ketone), 1604.77 (C=C, str. alkene), 3024.38 (=CH₂, str. alkene aliphatic and aromatic), 1496.76 (C=C, str. aromatic). 2916.37 and 2862.36 (C=H, str. aliphatic), 1450.47 (C=H₃, str. bend, aliphatic). 1H-NMR (60 MHz, CDCl₃, 5 (ppm)) = 8.20-7.20 (m, 1H, =CHβ, Ar 2', 6', =CH₃, Ar 2', 6', 3', 5', 3', 5', 4'); 2.45 (s, 3H, CH₃). Mass spectrum (EI, m/z) = 222 (M⁺, C₁₅H₂₄O₂, 86.55%), 221 (M-1, C₁₄H₂₃O₂, 100%), 207 (C₁₃H₂₁O₂, 24.07%), 179 (C₁₂H₁₉O₂, 20.60%), 165 (C₁₁H₁₅O₂, 4.06%), 131 (C₁₀H₁₃O₂, 33.61%), 119 (C₉H₁₁O₂, 55.24%), 103 (C₈H₉O₂, 36.08%), 91 (C₇H₇O₂, 58.84%), 77 (C₆H₅O₂, 32.61%), 65 (C₅H₅O₂, 30.74%), 51 (C₄H₃O₂, 15.22%).

**4'-Methoxychalcone (3), C₁₅H₁₈O₃**

It was crystallized from ethyl alcohol as yellow precipitates (1.0809 g), yield 91.76%, m.p. 107.6-108.23 °C (lit. [13] 107.7-108.6 °C); Rf = 0.56 (Benzene); the retention time of GC = 11.992 min.

UV-Vis (λmax, CHCl₃) = 241 and 319 nm. IR spectrum (νmax cm⁻¹, KBr) = 1651.07 (C=O, str. ketone), 1604.77 (C=C, str. alkene), 3055.24 (=CH₂, str. alkene aliphatic and aromatic), 1573.61 and 1496.76 (C=C, str. aromatic). 2931.80 and 2839.22 (C=H, str. aliphatic), 1427.32 (C=H₃, str. bend, aliphatic). 1300-1100 (C=O—OH, stretch, ether). 1H-NMR (60 MHz, CDCl₃, 5 (ppm)) = 8.00-8.30 (d, 1H, =CHβ), 7.80-7.40 (m, 8H, Ar 2', 6', 5', =CH₁, Ar 2', 6', 3', 5', 4'-H), 7.20-6.90 (d, 2H, Ar 3', 5'-H), 3.80 (s, 3H, OCH₃). Mass spectrum (EI, m/z) = 238 (M⁺, C₁₅H₂₄O₃, 100%), 237 (M-1, C₁₄H₂₃O₃, 81%), 223 (C₁₃H₂₁O₃, 16.69%), 207 (C₁₂H₁₉O₃, 10%), 135 (C₁₀H₁₇O₃, 77%), 131 (C₉H₁₅O₃, 100%).

Cytotoxic activity

The cytotoxic effect of chalcone and its derivatives was performed on HeLa cell lines by MTT assay. The advantage of this method was that could be conducted fast and accurately, without using of radioscopy compound. The solvent used in this assay was DMSO, due to the low solubility of the test compounds in aqueous cell medium. Previous study about the influence of various concentration of DMSO on the death of HeLa cell showed that concentration of DMSO up to 0.25% v/v did not affect the death of HeLa cell [16].

This colorimetric assay is based on the capacity of mitochondria succinate dehydrogenase enzymes in living cells to reduce the yellow water soluble substrate 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide (MTT) into an insoluble, colored formazan product which is measured spectrophotometrically. Since reduction of MTT can only occur in metabolically active cells, the level of activity is a measure of the viability of the cells. The color from yellow to purple was due to the break down of tetrazoiium ring (Fig. 4). Absorbance of soluble Formazan was determined by ELISA reader at 550 nm. The absorbance was correlated to live cells count. The death cells could not reduce MTT due to infection of the enzyme. Fig. 5 illustrated the morphology of HeLa cell line after exposed of MTT.

Dose response curves constructed for MTT method between the range of 3.125-100 µg/mL. Calculation of IC₅₀ values was done using viability analysis. The results indicated that the antiproliferative effect strengthens with increase in the concentration of test compounds. From Table 1, it was observed that the highest cytotoxic activity was found with chalcone having IC₅₀ value of 9.49 µg/mL. Lower activity was showed by 3',4'-dichlorochoalcone with IC₅₀ value of 24.26 µg/mL.

The methyl and methoxy substituent at C-4' of aromatic ring directly bonded to enone ketone group (C region) decreased the cytotoxic activity of chalcone, the parent compound. The lowering activity of methyl substituent was larger than that of methoxy substituent. Substitution by chlor at C-3' and 4' of aromatic ring directly bonded to enone ketone group gave the largest effect on lowering cytotoxic activity of chalcone.

Test result of cytotoxic activity of chalcone synthesized by Utami [9] on HeLa cells line, gave the IC₅₀ value of 9.77 µg/mL. It was not significantly different from our result (9.58 µg/mL). Robinson et al. [1] also synthesized the same chalcone derivatives compounds, by the synthesis method based on the Claisen-Schmidt condensation reaction using alkaline catalyst KOH. However, the cytotoxic activity of their product was conducted as in vitro cytotoxic activity on SVR endothelial cells. Utami [9] have tested the cytotoxic activity of synthesized chalcone derivatives compounds, which were the result of modification of the parent compound in the aromatic ring on the beta position of the ketone carbonyl group, on HeLa cells. Chalcone derivatives compounds in this study were the results of modification of the parent compound on the aromatic ring directly bound to the carbonyl group.

CONCLUSION

Chalcone and its derivatives, 4'-methylchalcone, 4'-methoxycalcone, 3',4'-dichlorochoalcone, were able to be synthesized by alkaline condensation of acetophenone, p-methyleacetophenone, p-methoxy acetophenone, m,p-dichloroacetophenone and benzaldehyde. Cytotoxic activity on human breast...
cancer cell lines of chalcone was highest compared to its derivatives. It was concluded that methyl, methoxy as well as chlorine substitution at 3\textsuperscript{1} and 4\textsuperscript{1} position decrease the cytotoxic activity of chalcone.
